

NEW ENERGY BRINGS NEW OPPORTUNITY

NEW UK MANUFACTURING - NEW UK JOBS

The UK energy challenge is well understood and accepted by all. As a nation we now need to move swiftly to meet that challenge. The current dash for gas will not bring a long term secure supply of energy; what is needed is a combination of nuclear, clean coal, gas and renewables. There is the will and enthusiasm to manufacture and construct the power plants required between now and 2020.

Considering the current plight of UK manufacturing, this energy expansion brings with it untold opportunities for the UK's Engineering Supply Chain companies. They have a proven track record demonstrating their ability to deliver state of the art engineering products and we have the people with the right entrepreneurial skills who are excited to be involved. There is no doubt that these enormous investments can and must herald the renaissance of UK engineering with the thousands of quality jobs that this will bring.

There is an unprecedented opportunity for the UK's Engineering Supply Chain with an investment of £50bn in new energy projects, not only to meet our nation's requirements, but also to establish a platform to sell their expertise and products globally in a time of predicted global energy shortage.
